

## Problem

A post on facebook is said to be more *popular* if the number of likes on the post is **strictly greater** than the number of likes on some other post. In case the number of likes is same, the post having more comments is more *popular*.

Given arrays  $A$  and  $B$ , each having size  $N$ , such that the number of likes and comments on the  $i^{\text{th}}$  post are  $A_i$  and  $B_i$  respectively, find out which post is most *popular*.

It is guaranteed that the number of comments on all the posts is **distinct**.

### Input Format

- The first line of input will contain a single integer  $T$ , denoting the number of test cases.
- Each test case consists of multiple lines of input.
  - The first line of each test case contains a single integer  $N$ , the number of posts.
  - The second line of each test case contains  $N$  space-separated integers  $A_1, A_2, \dots, A_N$  — where  $A_i$  is the number of likes on the  $i^{\text{th}}$  post.
  - The third line of each test case contains  $N$  space-separated integers  $B_1, B_2, \dots, B_N$  — where  $B_i$  is the number of comments on the  $i^{\text{th}}$  post.

### Output Format

For each test case, output on a new line, an integer in the range 1 to  $N$ , denoting the index of the post which is most popular among the  $N$  posts.

### Constraints

- $1 \leq T \leq 1000$
- $1 \leq N \leq 10^5$
- $1 \leq A_i, B_i \leq 2 \cdot 10^5$
- The elements of array  $B$  are distinct.
- It is guaranteed that the sum of  $N$  over all test case does not exceed  $2 \cdot 10^5$ .

### Sample 1:

Input	Output
4	1
3	2
5 4 4	3
1 2 3	2
3	
10 10 9	
2 5 4	
3	
3 3 9	
9 1 3	
4	
2 8 1 5	
2 8 1 9	

### Explanation:

**Test case 1:** The number of likes on the first post is greater than that of second and third post. Thus, the first post is most popular.

**Test case 2:** The first and second post have maximum number of likes. But, the second post has more comments than the first post. Thus, the second post is most popular.

**Test case 3:** The number of likes on the third post is greater than that of first and second post. Thus, the third post is most popular.

**Test case 4:** The number of likes on the second post is greater than that of first, third, and fourth post. Thus, the second post is most popular.
